

**Supplementary Table 1:** List of exclusion criteria for the control group.

	<b>Subgroup</b>	<b>ICD-10</b>
<b>Mental and Behavioural disorders (F-labeled)</b>	Physiological conditions	F01 - F03
	Psychoactive substance use	F10 – F19
	Schizophrenia, schizotypal, delusional, and schizoaffective disorder	F20 - F22, F25
	Mood affective disorders	F31, F33
	Intellectual disabilities	F70 – F72
<b>Diseases of the central nervous system (G-labeled)</b>	Inflammatory diseases	G04 – G07
	Systematic atrophies	G10 - G13, G14
	Extrapyramidal and movement disorders	G20 – G25
	Other degenerative diseases	G30-G32
	Demyelinating diseases	G35-G37
	Episodic and paroxysmal disorders	G40, G41, G45
<b>Neoplasms (C-labeled)</b>	Malignant neoplasm of the brain	C71

**Supplementary Table 2:** Characteristics of neurotransmitter PET maps used.

Bold numbers highlight regions with significant differences in a specific measure (fALFF, LCOR, or GCOR) between PD and the matched subgroup of HC.

# Supplementary Figures

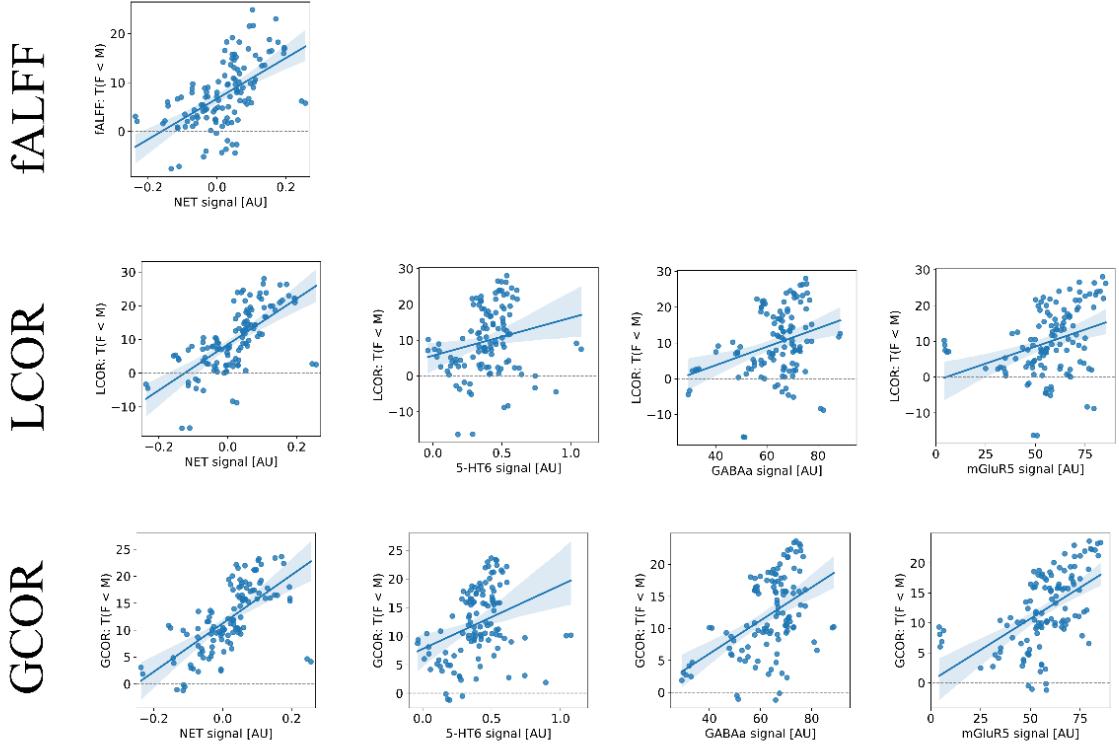

**Supplementary Figure 1:** Significant linear correlations between unthresholded age-effect (slope) maps in fALFF, LCOR, and GCOR, and neurotransmitter systems – *before atrophy correction*. Corresponding correlation coefficients are visualized in Figure 2B.  $\Delta$ Measure corresponds to the annual rate of in- or decrease in the respective measure of brain function (fALFF, LCOR, or GCOR) within one region.

**Supplementary Figure 2:** Significant linear correlations between of unthresholded age-effects (slope maps) in fALFF, LCOR, and GCOR, and multiple neurotransmitter systems – *after atrophy correction*.  $\Delta$ Measure corresponds to the annual rate of in- or decrease in the respective measure of brain function (fALFF, LCOR, or GCOR) within one region.

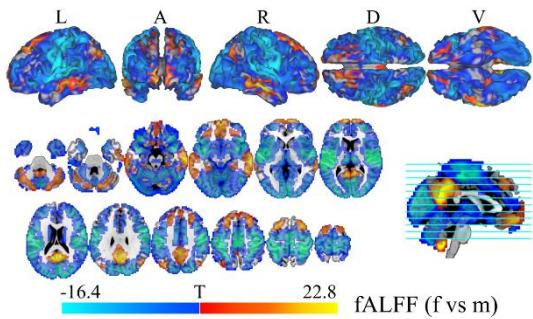

**Supplementary Figure 3:** Significant linear correlations of unthresholded sex effects (T-values) in fALFF, LCOR, and GCOR and NET, GABAa, mGluR5, and 5-HT6 availability – *before atrophy correction*.

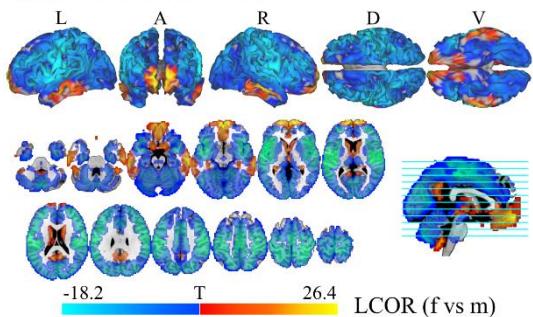

**Supplementary Figure 4:** Significant linear correlations of unthresholded sex effects (T-values) in fALFF, LCOR, and GCOR and NET, GABAa, mGluR5, and 5-HT6 availability – *after atrophy correction*.

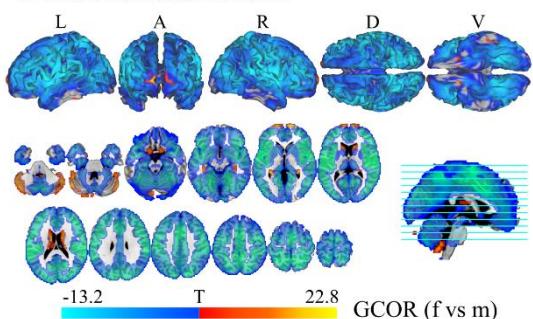

A : Sex-differences in fALFF

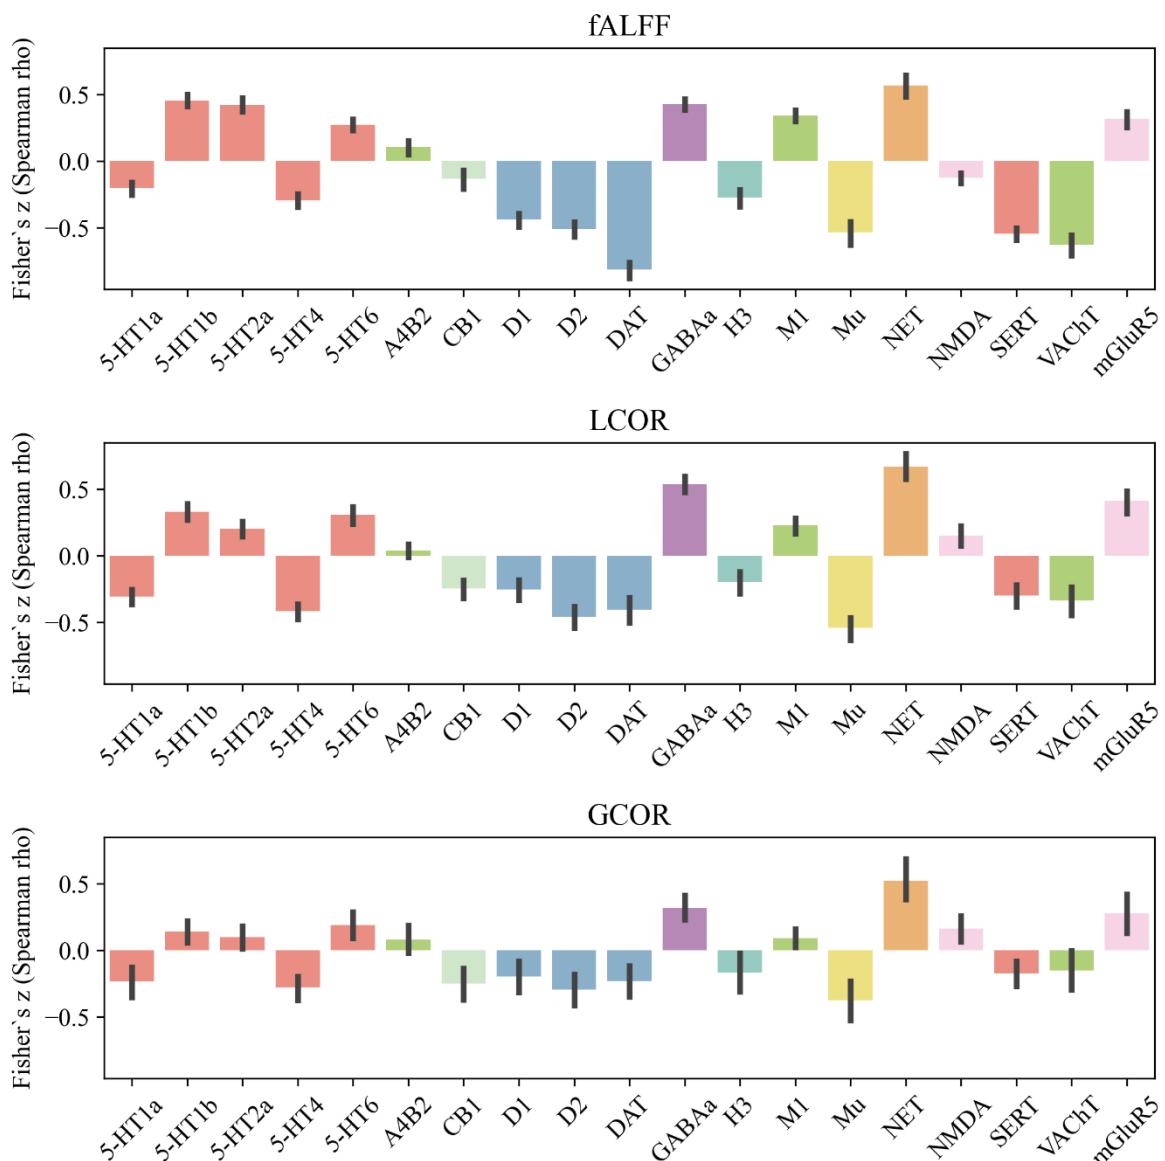

B : Sex-differences in LCOR

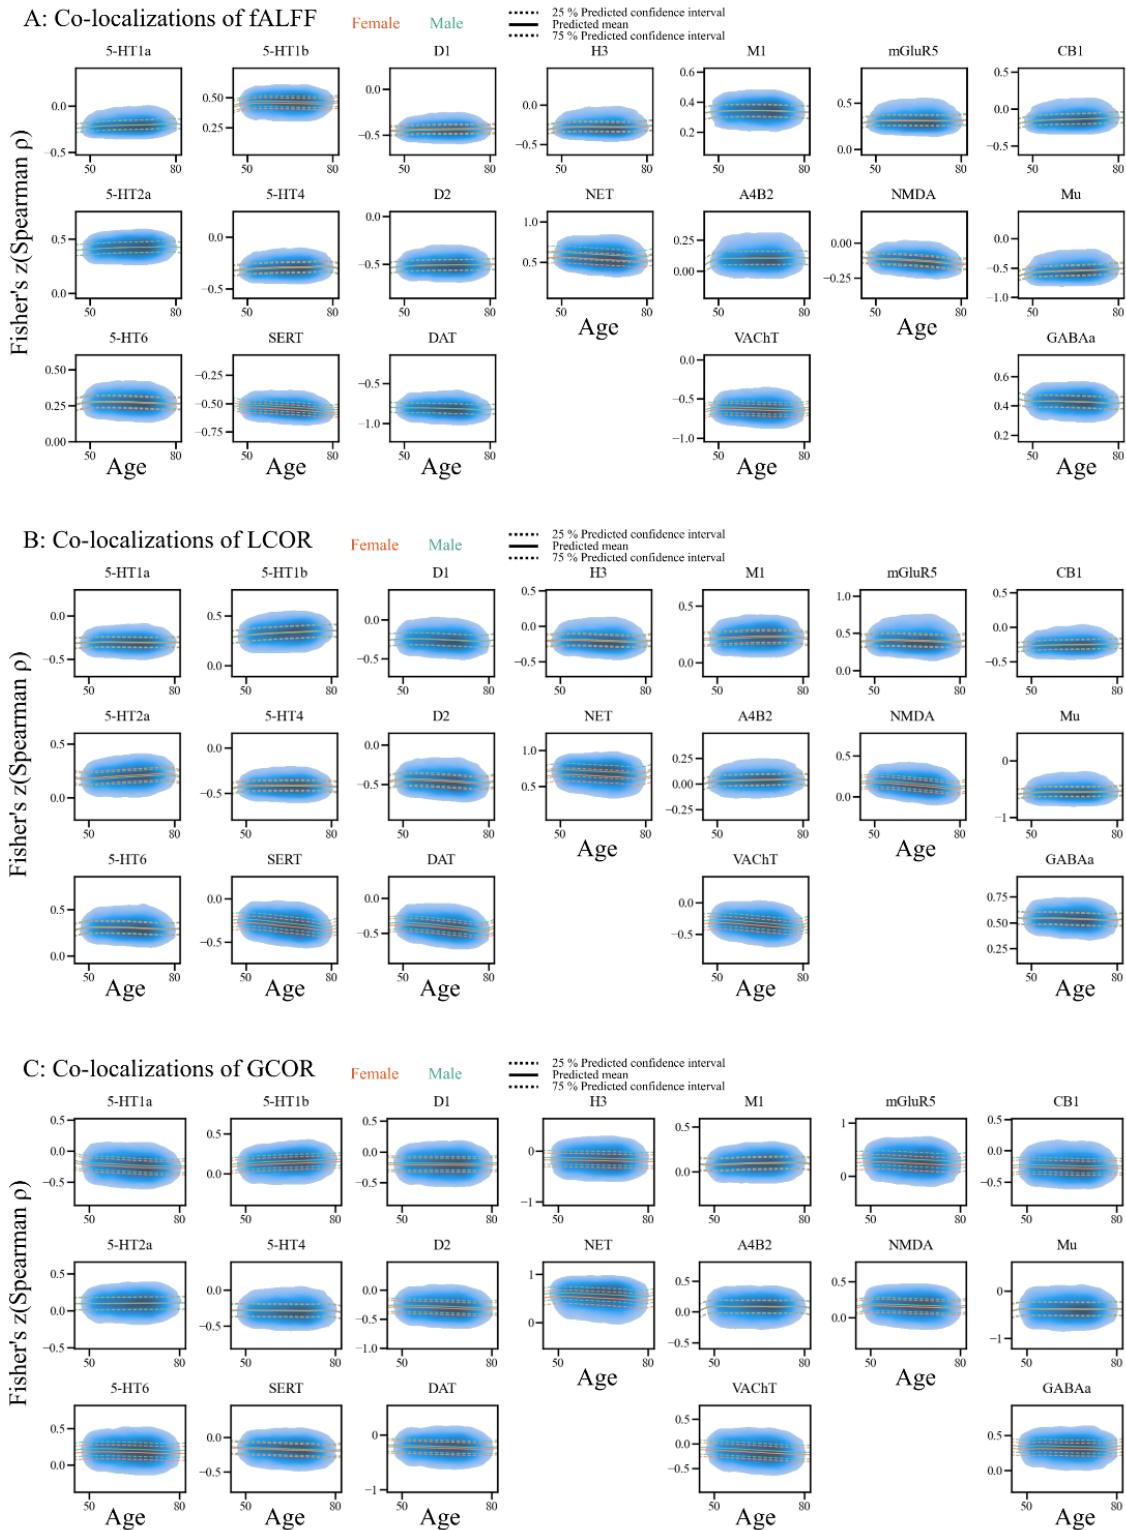

C : Sex-differences in GCOR

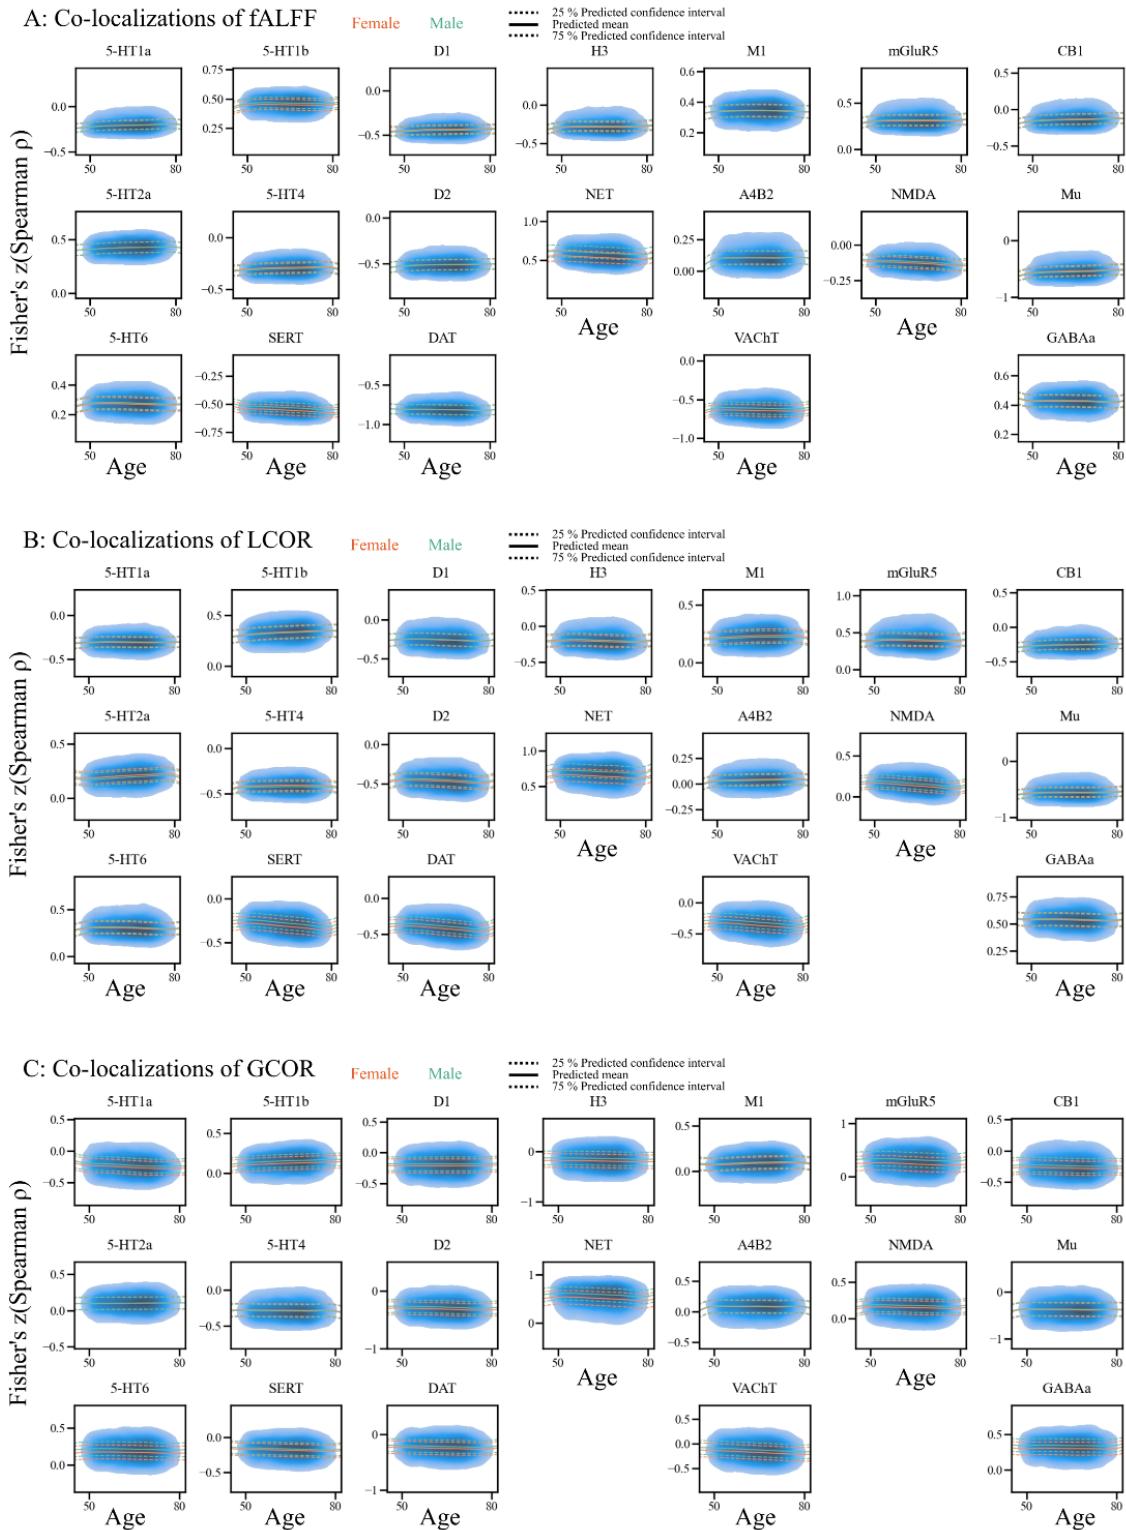

**Supplementary Figure 5:** Sex differences (T-values) in brain functional measures, thresholded. Red voxels indicate higher values in women compared to men and blue voxels indicate the inverse.

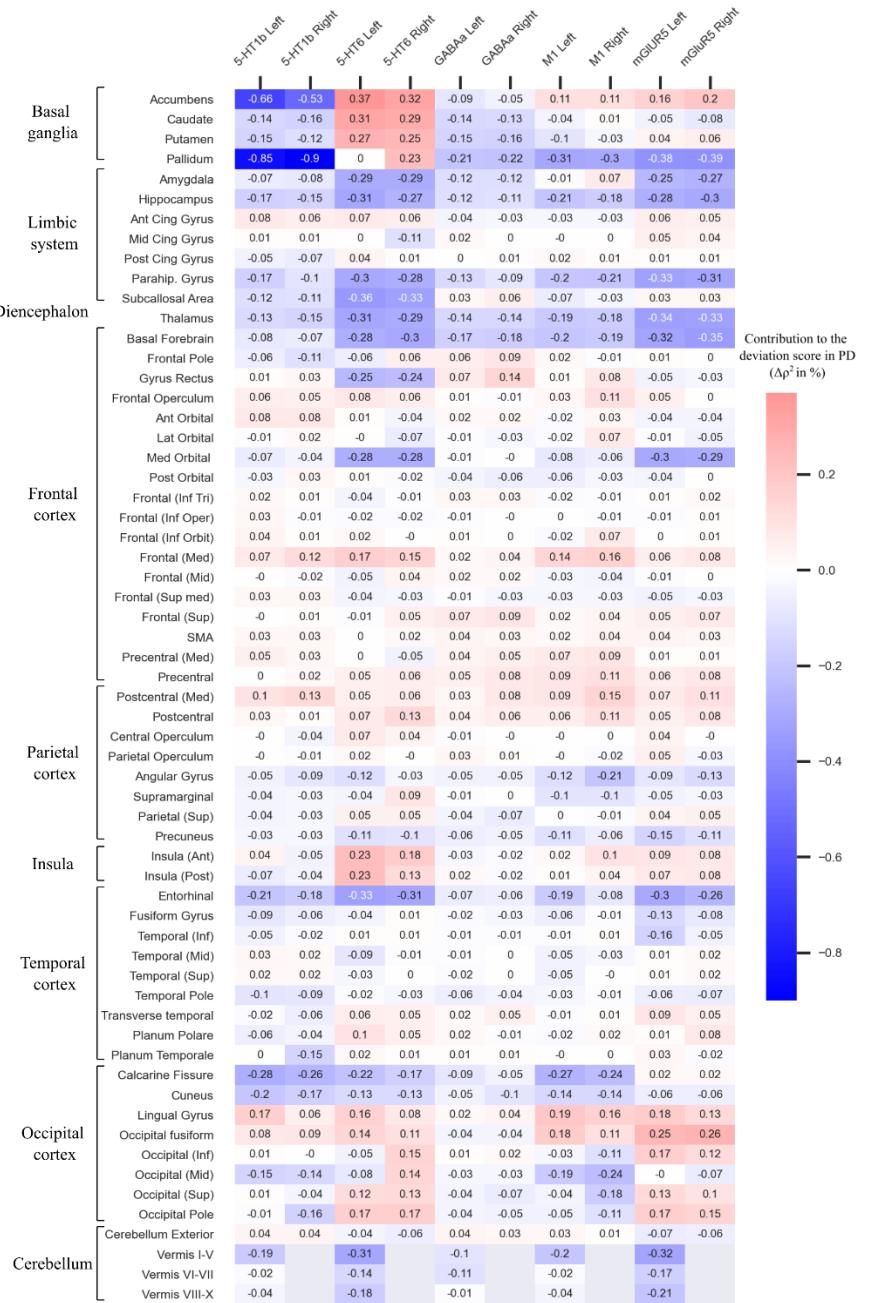

**Supplementary Figure 6.** Bar plots show the healthy control cohort's mean Fisher's z-transformed Spearman correlation coefficients. These coefficients were derived from the spatial correlation analyses of individual fALFF (top), LCOR (middle), and GCOR (bottom) maps and 19 PET maps of neurotransmitter systems. Vertical bars indicate the 50% quantile. Colors group receptors and transporters of the same neurotransmitter system, i.e., serotonin (red), dopamine (blue), acetylcholine (green), glutamate (pink) and GABA (purple), cannabinoid (mint), opioid (yellow), norepinephrine (orange), and histamine (turquoise).

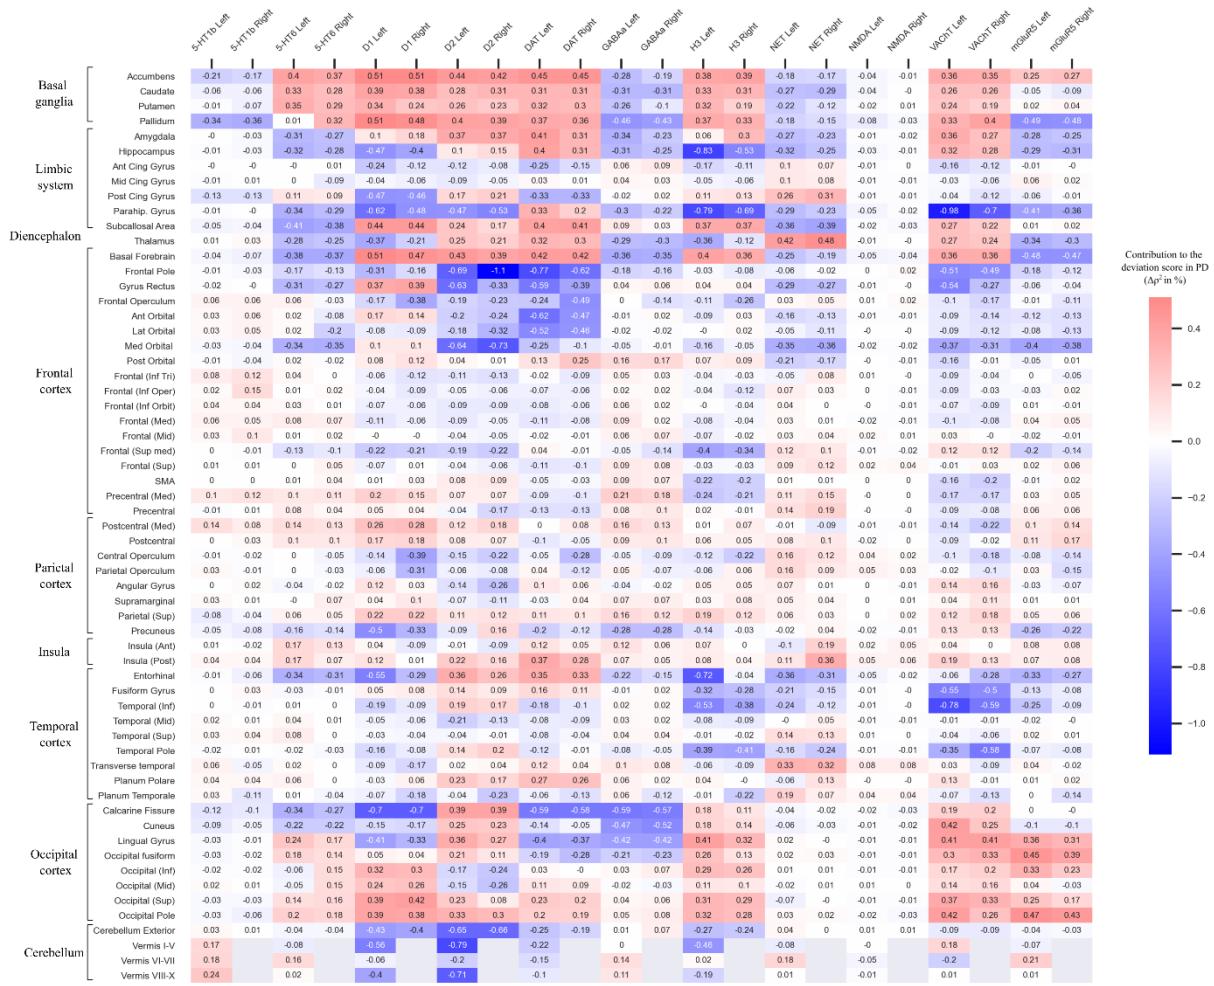

**Supplementary Figure 7:** Normative models of co-localizations between brain function (A: fALFF, B: LCOR, C: GCOR) and 19 PET maps – *before atrophy correction*. Within each subplot, the blue cloud (kernel density estimation) visualized the distribution of Fisher's z-transformed Spearman correlation coefficients of all healthy controls. Solid and dashed lines indicate the predicted median and 25 and 75% confidence interval of men (turquoise) and women (orange).

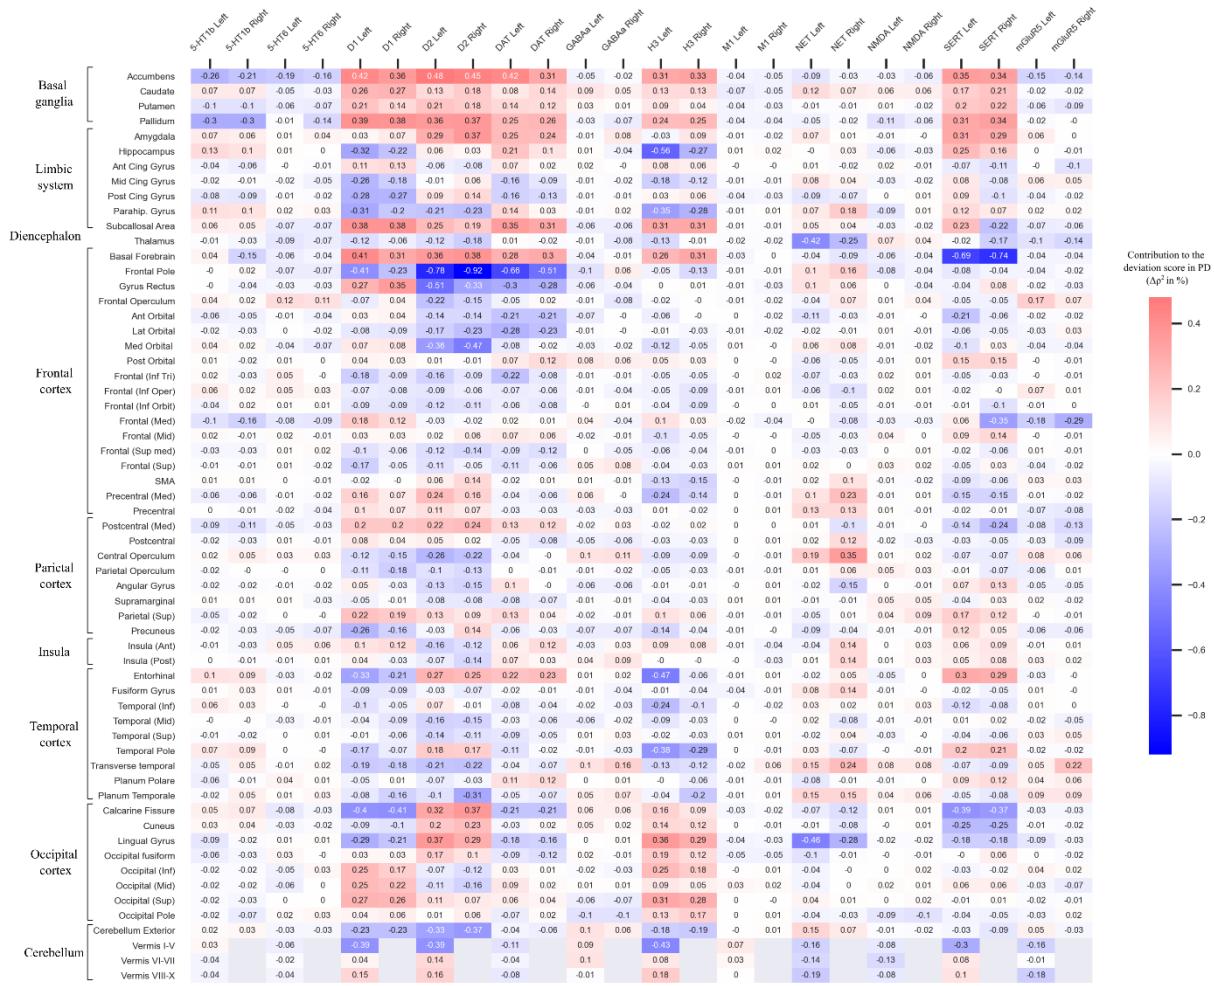

**Supplementary Figure 8:** Normative models of co-localizations between brain function (A: fALFF, B: LCOR, C: GCOR) and 19 PET maps – *after atrophy correction*. Within each subplot, the blue cloud (kernel density estimation) visualized the distribution of Fisher's z-transformed Spearman correlation coefficients of all healthy controls. Solid and dashed lines indicate the predicted median and 25 and 75% confidence interval of men (turquoise) and women (orange).

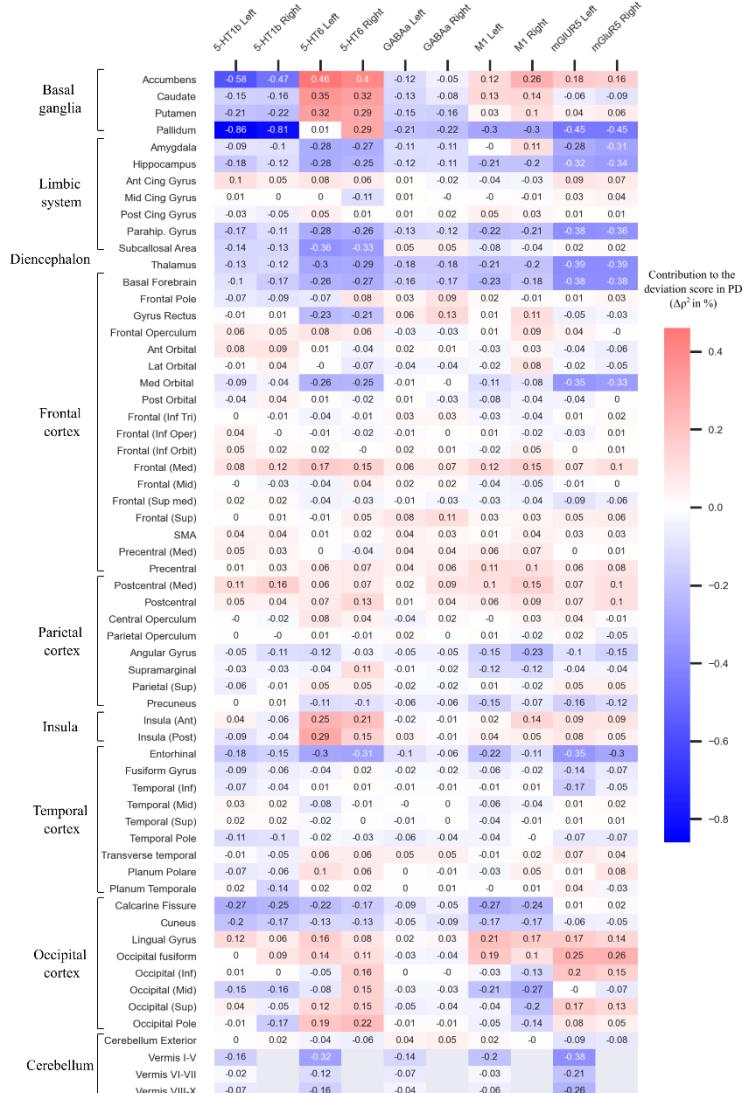

**Supplementary Figure 9:** Contribution of each region to the deviation in fALFF co-localizations in subjects with manifest Parkinson's disease – *before atrophy correction*. The contribution is quantified by the mean change in squared spatial correlation coefficient (mean  $\Delta\rho^2$ ) after leaving the specific region out from the spatial correlation analysis. Values of regions of the left or right hemisphere are arranged next to each other (column-wise) for each neurotransmitter system. The rows are sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, motor area, parietal cortex, temporal cortex, occipital cortex, cerebellum. Red cells, i.e. positive values, indicate that leaving this specific region out in the individual co-localization analysis led to a correlation coefficient that was closer to the norm.

**Supplementary Figure 10:** Contribution of each region to the deviation in LCOR co-localizations in subjects with manifest Parkinson's disease – *before atrophy correction*. The contribution is quantified by the mean change in squared spatial correlation coefficient (mean  $\Delta\rho^2$ ) after leaving the specific region out from the spatial correlation analysis. Values of regions of the left or right hemisphere are arranged next to each other (column-wise) for each neurotransmitter system. The rows are sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, parietal cortex, temporal cortex, occipital cortex, cerebellum. Red cells, i.e. positive values, indicate that leaving this specific region out in the individual co-localization analysis led to a correlation coefficient that was closer to the norm.

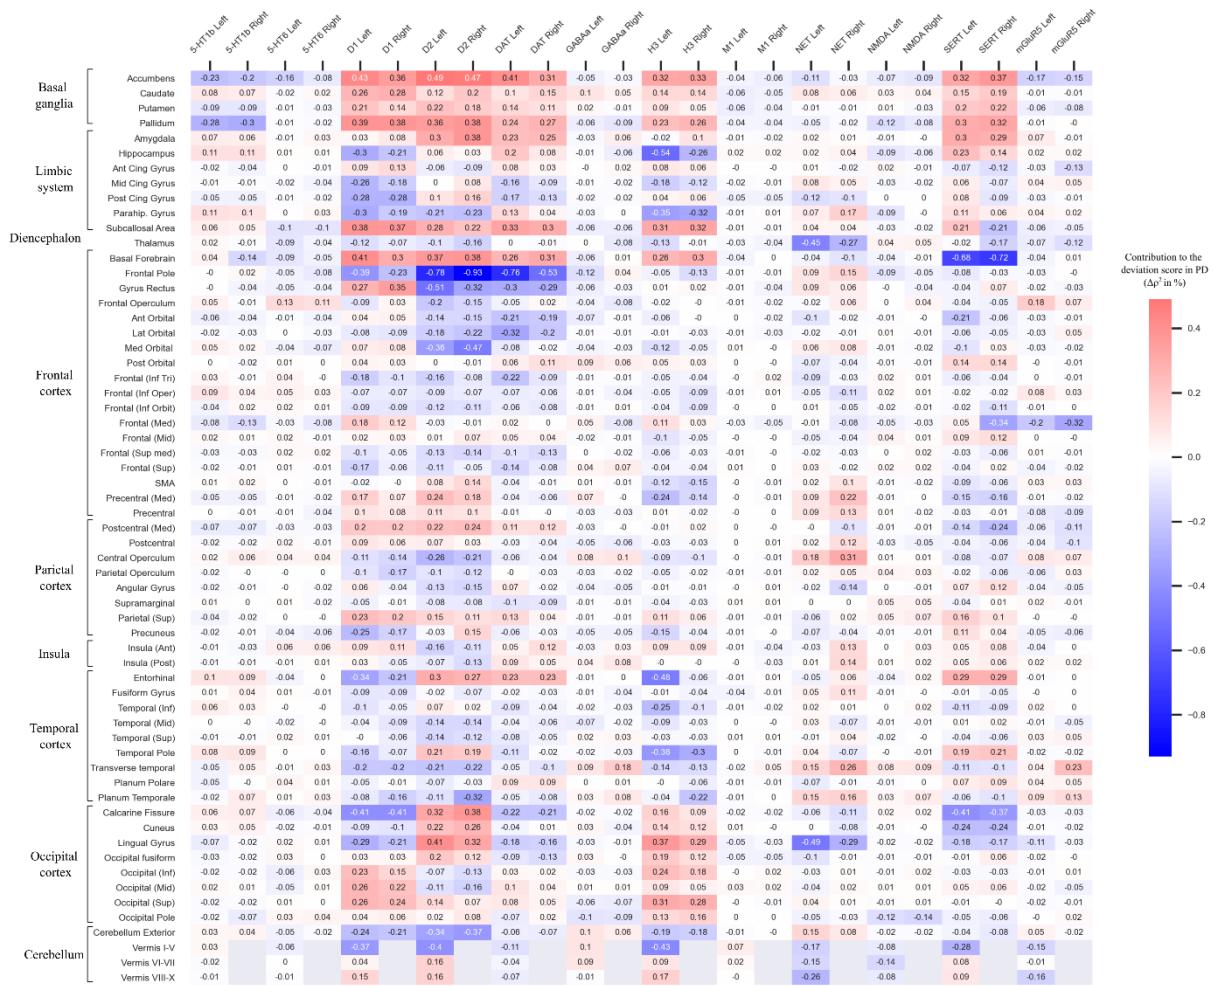

**Supplementary Figure 11:** Contribution of each region to the deviation in **GCOR** co-localizations in subjects with manifest Parkinson’s disease – *before atrophy correction*. The contribution is quantified by the mean change in squared spatial correlation coefficient (mean  $\Delta\rho^2$ ) after leaving the specific region out from the spatial correlation analysis. Values of regions of the left or right hemisphere are arranged next to each other (column-wise) for each neurotransmitter system. The rows are sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, parietal cortex, temporal cortex, occipital cortex, cerebellum. Red cells, i.e. positive values, indicate that leaving this specific region out in the individual co-localization analysis led to a correlation coefficient that was closer to the norm.

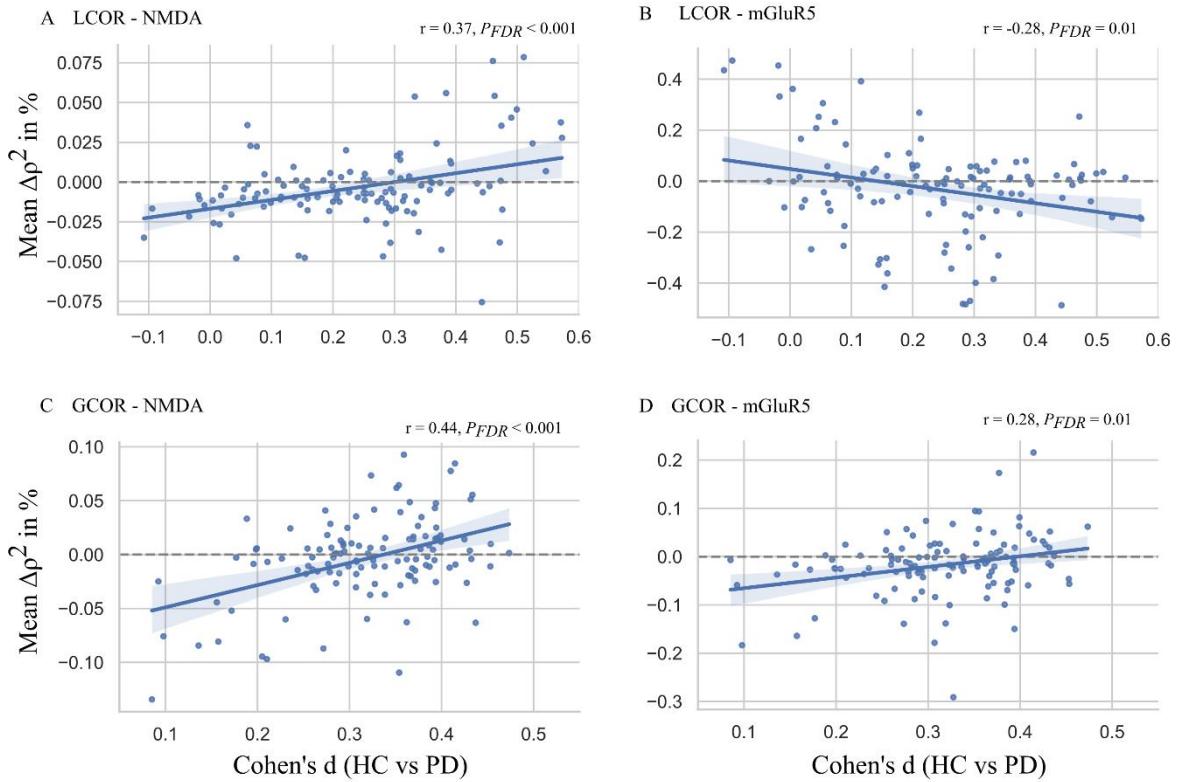

**Supplementary Figure 12:** Contribution of each region to the deviation in fALFF co-localizations in subjects with manifest Parkinson’s disease – *after atrophy correction*. The contribution is quantified by the mean change in squared spatial correlation coefficient (mean  $\Delta\rho^2$ ) after leaving the specific region out from the spatial correlation analysis. Values of regions of the left or right hemisphere are arranged next to each other (column-wise) for each neurotransmitter system. The rows are sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, parietal cortex, temporal cortex, occipital cortex, cerebellum. Red cells, i.e. positive values, indicate that leaving this specific region out in the individual co-localization analysis led to a correlation coefficient that was closer to the norm.

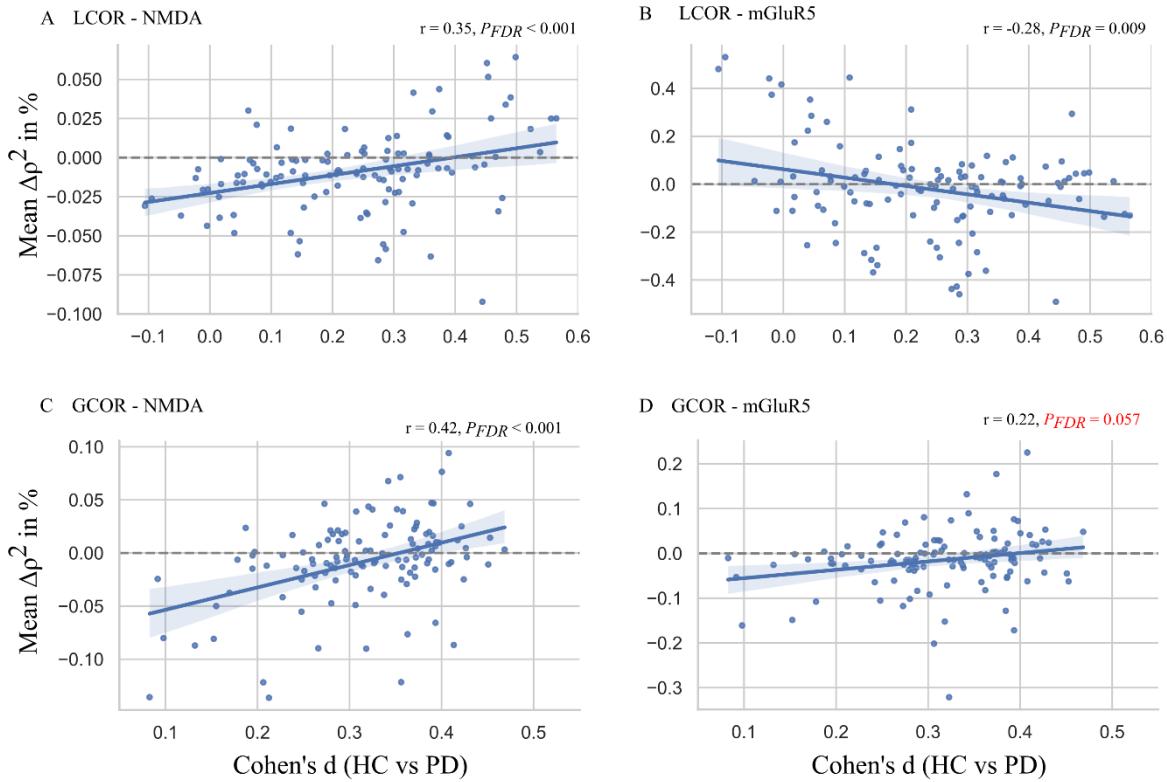

**Supplementary Figure 13:** Contribution of each region to the deviation in LCOR co-localizations in subjects with manifest Parkinson’s disease – *after atrophy correction*. The contribution is quantified by the mean change in squared spatial correlation coefficient (mean  $\Delta\rho^2$ ) after leaving the specific region out from the spatial correlation analysis. Values of regions of the left or right hemisphere are arranged next to each other (column-wise) for each neurotransmitter system. The rows are sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, parietal cortex, temporal cortex, occipital cortex, cerebellum. Red cells, i.e. positive values, indicate that leaving this specific region out in the individual co-localization analysis led to a correlation coefficient that was closer to the norm.

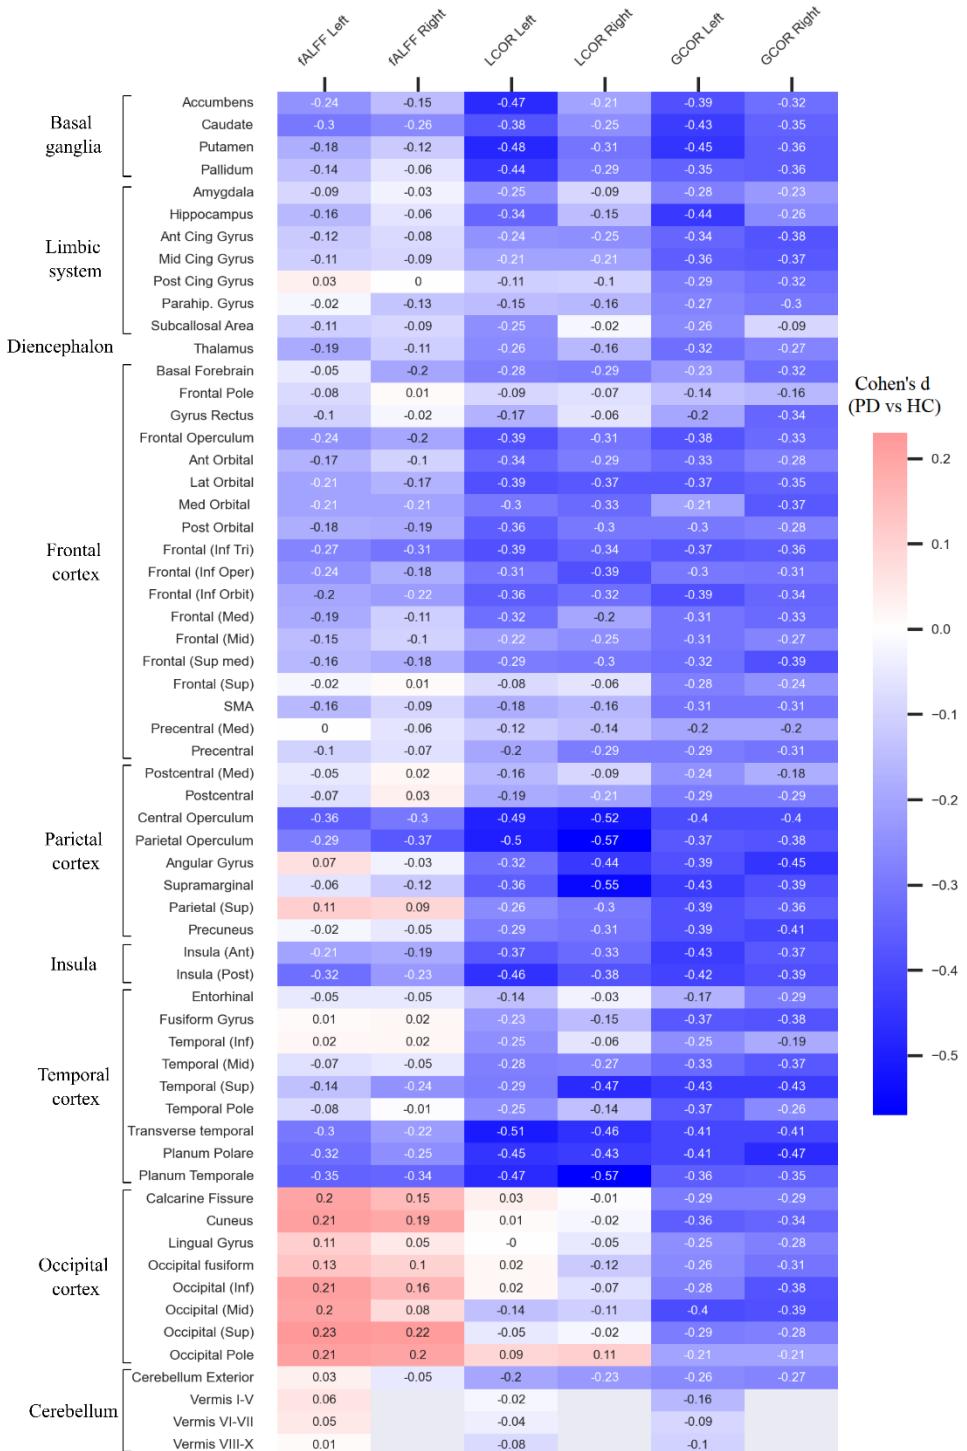

**Supplementary Figure 14:** Contribution of each region to the deviation in GCOR co-localizations in subjects with manifest Parkinson’s disease – *after atrophy correction*. The contribution is quantified by the mean change in squared spatial correlation coefficient (mean  $\Delta\rho^2$ ) after leaving the specific region out from the spatial correlation analysis. Values of regions of the left or right hemisphere are arranged next to each other (column-wise) for each neurotransmitter system. The rows are sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, parietal cortex, temporal cortex, occipital cortex, cerebellum. Red cells, i.e. positive values, indicate that leaving this specific region out in the individual co-localization analysis led to a correlation coefficient that was closer to the norm.

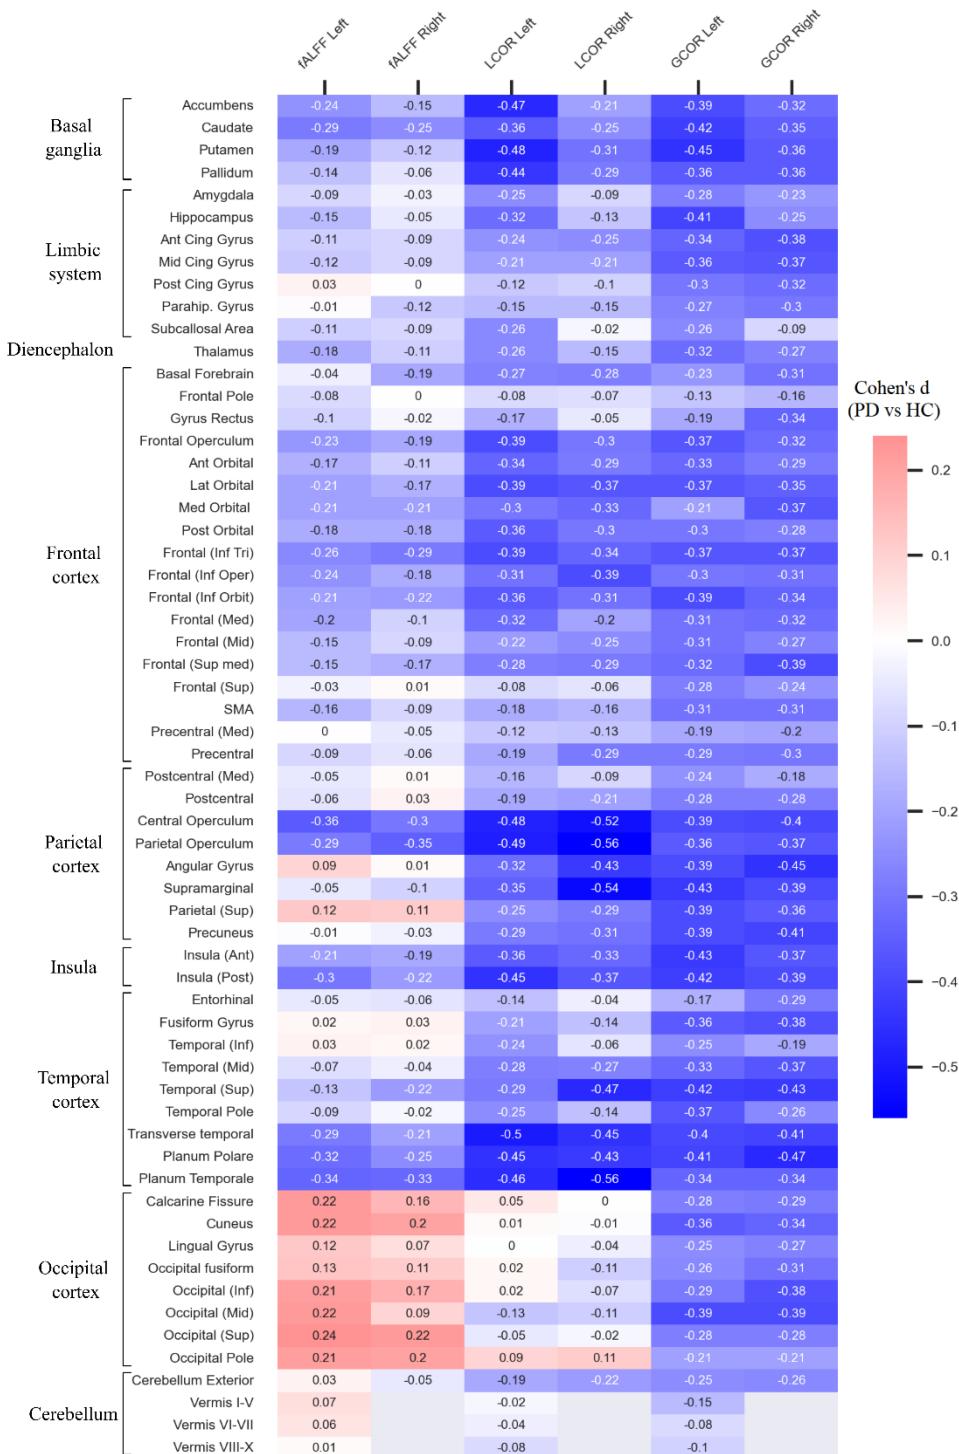

**Supplementary Figure 15:** Linear correlation of regional contribution (mean  $\Delta\rho^2$ ) to the deviation score and functional differences (Cohen's d) between PD and the matched subcohort of healthy controls – *before atrophy correction*.

**Supplementary Figure 16:** Linear correlation of regional contribution (Mean  $\Delta\rho^2$ ) to deviation score and functional differences (Cohen's d) between PD and the matched subcohort of healthy controls – *after atrophy correction*.

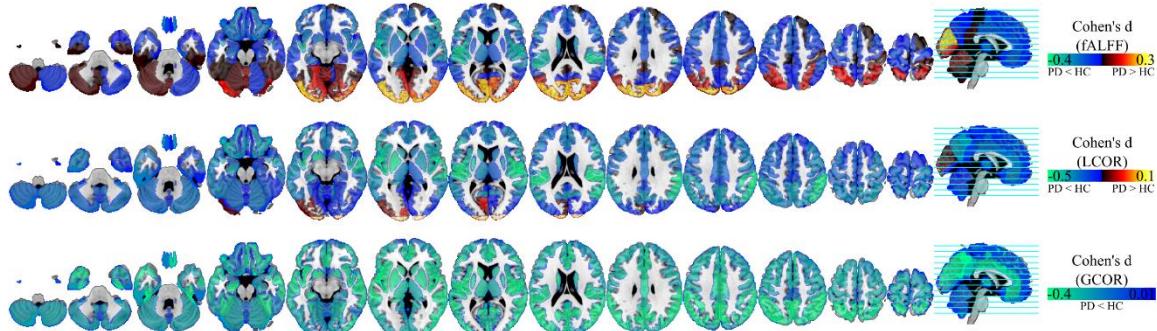

**Supplementary Figure 17:** Regional differences (effect sizes, Cohen's d) in fALFF, LCOR, and GCOR between manifest PD and the age- and sex-matched control group – *before atrophy correction*. Positive values (red cells) indicate higher values of brain functional measures in PD and negative values (blue cells) indicate the inverse. Values of regions of the left or right hemisphere are arranged next to each other (column-wise). The list is sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, parietal cortex, temporal cortex, occipital cortex, cerebellum. Regional values are visualized in Supplementary Figure 19A.

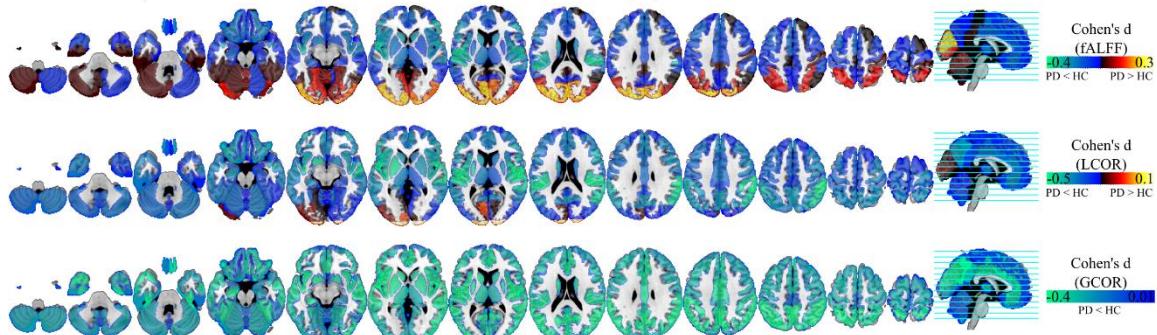

**Supplementary Figure 18:** Regional differences (effect sizes, Cohen's d) in fALFF, LCOR, and GCOR between the age- and sex-matched control group and PD – *after atrophy correction*. Positive values (red cells) indicate higher values of brain functional measures in PD and negative values (blue cells) indicate the inverse. Values of regions of the left or right hemisphere are arranged next to each other (column-wise). The list is sorted from top to the bottom: Basal ganglia, limbic system, diencephalon, frontal cortex, motor area, parietal cortex, temporal cortex, occipital cortex, cerebellum. Regional values are visualized in Supplementary Figure 19B.

A: Effect size (PD vs HCmatched) in functional measures

B: Effect size (PD vs HCmatched) in functional measures after atrophy correction

**Supplementary Figure 19:** Maps of regional differences in fALFF, LCOR, and GCOR between the age- and sex-matched control group and PD. Values of regions correspond to those of Supplementary Figure 17 and 18 (atrophy corrected).
